

Bayesian Data Analysis

Instructor: I. Ntzoufras

Elective Course, 4th semester, 5 ECTS units

Course level: Graduate (MSc)

Language: Greek

Course Description

This course provides an introduction to the Bayesian statistics and data analysis both from the theoretic and the computational perspective using R and WinBUGS/STAN. The course syllabus includes Bayesian inference, conjugate Analysis, simulation and random number generation, Markov chain Monte Carlo (MCMC) methods, Introduction to WinBUGS/STAN, Bayesian inference for Regression and GLMs, Hierarchical models, Bayesian model and variable selection. All methods are used to analyze real datasets and cases.

Prerequisites

The students should have a good quantitative and computational background. Specifically, knowledge in the fields of calculus, probability/distribution theory, statistical modelling and R programming will be necessary for this course.

Target Learning Outcomes

Upon completion of the course, students will be able to:

- 1) Understand the basic theory and philosophy of Bayesian Statistics
- 2) Understand the basic notions of Bayesian computation
- 3) Analyze data using WinBUGS/STAN
- 4) Build models (glm and hierarchical) in WinBUGS/STAN
- 5) Perform Bayesian variable selection using WinBUGS/STAN and in R.

Recommended Bibliography

Teaching and Learning Activities

- Live teaching in a lecture room or computer labs
- Informal labs for using R and WinBUGS/OpenBUGS/JAGS/STAN
- Evaluation of current knowledge using quizizz web game

- Interim optional exercises
- Personalized assignment/project

Assessment and Grading Methods

The course is examined by a big project/assignment that contributes 100% of the final grade. The students can break the final outcome/assignment in smaller landmark exercises (optional) that will help him to construct the final project report.
